

## **Amp'ed RF Technology Product Change Notes**

7/18/2019

**Subject:** Revision to Bluetooth IC on BT24H

**Effective date:** 9/01/2019

**New version:** v1.1

**Previous version:** v1.0

### **Details:**

The Bluetooth IC manufacturer has halted production on a revision/option on their chip:

New: RDA5876 (original version)

Old: RDA5876 rev A

RDA 5876 changes: A performance enhancement for the PCM interface, used with Handsfree Profile, was introduced with revision A. Revision A is no longer available. This change notice is reverting to the original version, thus un-doing the PCM interface enhancement.

Amp'ed RF is using the STM32F4 as a host MCU, which does not utilize the PCM interface option. The reason for using the rev A chip was due to a lower price offered by the manufacture. The effect of this change is a slightly higher cost, but no hardware or firmware changes. Please contact your sales rep for an updated price.

### **Changes:**

Firmware changes: None

Hardware changes: None
